# PRESENTING AN ALL-NEW SUBARU FOR 1998

*Coming Late Summer 1997*

- This all-new Subaru will be a unique, hybrid vehicle offering the sporty design, rugged performance and generous cargo capacity of an SUV and the ride quality, interior comfort and low step-height of a passenger car.
- In terms of vehicle size, this new Subaru will be comparable to a Jeep Cherokee and Honda CR-V but with a slightly shorter overall height than both vehicles—further establishing a new segment in the automotive market.
- Built in Japan, this vehicle will be officially classified as a passenger car, featuring the same active-safety engineering found aboard the Subaru Impreza and Legacy models.
- Available exclusively with the Subaru All-Wheel Driving System, this new Subaru will offer maximized traction, stability and control in all weather and driving conditions.
- To assure “go-anywhere” driveability, this vehicle will have the same ground clearance as the versatile and popular Subaru Outback.
- Under the hood, a Subaru 2.5L DOHC boxer engine will deliver approximately 170 horsepower with potent high-end torque for quick acceleration and responsive passing power. In addition, the boxer’s compact, horizontal design enhances performance, reduces engine vibration and wear, and allows lower engine placement for improved handling stability.
- Performance will be further enhanced by an impressive power-to-weight ratio of 17.6 pounds—another attribute that will put this new Subaru in a class by itself.
